INDEPENDENT, OBJECTIVE AND EVIDENCE-BASED

Migraines: help for a common problem in children and teenagers

## **Children and teenagers can learn how to avoid some migraines and better understand their headaches and medication**

### **Some drugs can help, but Institute warns about using adult medications not approved for use by young people**

**Cologne, Germany: 17 December 2008.** Chocolate, excitement and the stress of Christmas: these are not just a headache for parents. They are also responsible for triggering migraines in many young people. Learning how to manage stress and avoid triggers are just as important as getting the right medication. However the German Institute for Quality and Efficiency in Health Care (IQWiG) today stressed that parents and young people need to be warned about the risks of using migraine medications that have only been approved for adults. The Institute has analysed the latest research on migraines and published information for children and young people on [informedhealthonline.org](http://www.informedhealthonline.org) (URL: <http://www.informedhealthonline.org>).

### **Help for children and teenagers battling migraines**

Migraines are common in children and teenagers: one in 10 young people battles these thumping headaches now and then. The good news: having migraines when you are a child does not necessarily mean a lifetime of these headaches. Many children will outgrow migraines.

Knowledge can help young people avoid and manage their migraines, according to the German Institute for Quality and Efficiency Health Care. It is important for children and young people to know the difference between the types of headaches, for example. Every headache is not a migraine. "Migraines in young people have the same throbbing pain on the side of the head as in adults, but there are differences as well," said Professor Peter Sawicki, the Director of the Institute. "Children's migraines can be shorter and they are more likely to also have abdominal pain or nausea. Most children will not have auras with flashing lights or wavy vision when they have migraines."

Although researchers have yet to identify the exact causes of migraines, specific factors or foods can trigger migraines in individuals - including chocolate. Stress and poor sleep are other frequent causes. Once a young person knows what is causing their migraines, they might be able to avoid some of the triggers or manage the problem better. "Keeping a migraine diary can show when there are genuine patterns around the headaches and what happens when you avoid - or have - a food you suspect, for

example," Professor Sawicki said.

### **Medication for migraine: different therapy for children and adolescents**

Lying down in a quiet dark room with a cold compress on the painful side of the head and trying to sleep it off will often be enough to get through a migraine attack. If more help is needed, the medicines proven to help young people the most without causing many adverse effects are ibuprofen and paracetamol. If they are not enough, a nasal spray of a migraine medication called sumatriptan is available for use from the age of 12.

There is a much wider variety of drugs available for adults, both as treatments and to take regularly to prevent very frequent migraines. However, these have not been approved for use in children and adolescents. "Medications often work differently in children and teenagers than they do in adults, and they can cause unexpected adverse effects in growing bodies," said Professor Sawicki. "This means you cannot just use smaller doses of all adult medications in children. Unfortunately, almost all migraine medications have not been tested in enough trials in children and adolescents to meet the requirements for drug approval."

Children and adolescents are often given adult medication. The Institute stresses that parents and young people need to be warned about the particular risks of what is called "off-label-use". Off-label drug use does not have the same level of scientific, legal and financial protection as approved medicine use.

### **Information for parents and young people**

The Institute has published the latest information from research in children and young people with migraines on its website, [Informed Health Online](http://www.informedhealthonline.org), including information on preventing and treating attacks. To help children and teenagers learn more about migraines, the Institute has published a fact sheet for them as well.

The Institute's website, [www.informedhealthonline.org](http://www.informedhealthonline.org) (URL: <http://www.informedhealthonline.org>), provides the public with easy-to-understand information about current medical developments and research on important health issues. If you would like to be kept up-to-date with the latest publications on the independent health information website, you can subscribe to the [informedhealthonline.org](http://www.informedhealthonline.org) newsletter (URL:

**The German Institute for Quality and Efficiency in Health Care (IQWiG)**

The German Institute for Quality and Efficiency in Health Care (IQWiG) was established by legislation to provide evaluations of the effectiveness, quality and efficiency of healthcare services. This includes the assessment of medicines as well as the publication of health information for consumers and patients.

**Evidence basis of our health information**

Our information is based primarily on systematic reviews of the effects of health care. Systematic reviews are necessary to gain an objective picture of health care. In order to do this, a clear question is formulated. Researchers then find all the relevant studies that could answer this question. They then evaluate those studies.

You can find a list of the evidence and other scientific literature on which this information is based at **[www.informedhealthonline.org](http://www.informedhealthonline.org)**
